

Bybit Intraday Trading Bot (30m, 5 pairs) — Context

Overview

This project implements a fully autonomous intraday trading bot for Bybit USDT Perpetual futures, operating on 30-minute candles across 5 selected pairs: - BTC/USDT - ETH/USDT - SOL/USDT - XRP/USDT - DOGE/USDT

Core Features

- Strategy logic with EMA/RSI/ATR signals
- Automated bracket orders (entry, TP, SL, trailing stop)
- Position sizing by risk (e.g. 1.5% of equity)
- Signal approval and optimization via OpenAI LLM
- Telegram logging for actions & errors
- AI-assisted exit/entry decisions (not hardcoded)
- .env/.env.local support for sensitive settings
- Logging with timestamps
- Crontab support for scheduled execution

Technical Stack

- Language: Python 3.11+
- Libraries: ccxt, pandas, requests, openai>=1.0.0, colorama, dotenv

File Structure

```
bybitbot/  
├─ bybit_intraday_30m_5pairs.py  # main bot logic  
├─ .env                          # default config  
├─ .env.local                    # override config  
├─ cronlog.txt                  # cron-based logs  
└─ trading_bot_context.md       # this file (context)
```

AI Integration

- OpenAI GPT is queried with indicators and recent OHLCV
- Model returns: `action`, `side`, `reason`, `sl`, `tp`, `reduce_size` (%), etc.
- SL/TP can be either fixed or dynamic (via model)
- All decisions are logged

Planned Improvements

- Position tracking (open/closed)
- Partial reductions on overbought/overheat
- Additional indicator support (MACD, trend filters)
- Refactor for modular strategy plugins
- Strategy backtesting mode

For bugs or suggestions, contact the developer or log to Telegram with `DEBUG_MODE=1`.
